Chemical Oceanography. Chemical oceanographers seek to understand the ways in which various elements are cycled within the oceans, and the reactions that these elements undergo. Ocean chemists improve our understanding of the basic conditions under which ocean life thrives in seawater, and help predict the effects of anthropogenic and natural climate change on ocean composition.

Chemical oceanography is a broad and complex study of the metamorphosis that the chemicals within oceans, living marine organisms, and the ocean floor undergo. The ocean contains a multitude of chemicals; some are natural, and others are man-made. These chemicals enter the sea in a number of ways. Rivers and streams bring freshwater into the ocean along the coast line. Freshwater brings the chemicals which have been dissolved into it from natural weathering and human activities. Examples of this

Chemical Oceanography is fundamentally interdisciplinary. The chemistry of the ocean is closely tied to ocean circulation, climate, the plants and animals that live in the ocean, and the exchange of material with the atmosphere, cryosphere, continents, and mantle. This diversity of influences on the chemistry of the ocean is represented by the research interests of the Chemical Oceanography faculty at the University of Washington, listed below, with links to the individual research groups.

Work on CO₂ system chemistry includes the development and oceanic application of novel systems for shipboard and in-situ measurements of pH, total inorganic carbon, alkalinity, and CO₂ fugacity. Development of systems for in-situ measurements of metals, nutrients and CO₂ system variables involves close work with a variety of colleagues at the Center for Ocean Technology (within the College of Marine Science).

The overarching goal of the Chemical Oceanography Lab is to improve the spatial and temporal resolution of nutrients and trace metal observations in the marine environment. We achieve this through field studies, oceanographic cruises and the development of automated analyzers with potential for in situ deployment.

Chemical oceanographers, also called marine chemists, marine geochemists, or even marine biogeochemists, may study one or a combination of the following: formation of seawater and seafloor sediments, relationships between chemical compounds (both organic and inorganic), how chemical inputs to the ocean (including pollution) affect it, and how the chemistry of the ocean affects or is affected by biological, geological, and physical factors.

Chemical oceanography is the study of the chemistry of the ocean. Whereas chemical oceanography is primarily occupied with the study and understanding of seawater properties and its changes, ocean chemistry focuses primarily on the geochemical cycles. The following is a central topic investigated by chemical oceanography.
